

Remote desktop hosting or servers give you the ability to work without the need for traditional pc, local network servers, or a network administrator. Your hosted desktop solution will seem no different to your end users, but your software applications and data will exist and operate on our servers offsite. This solution results in a streamlined IP operation with significantly reduced costs for equipment and employees.

Your users will login to the system via the internet from wherever an internet connection is available (home, office, hotel while travelling, etc.). All their data, applications, email, etc. will be at their disposal as if they were working from the office. It's that easy!

There are no network servers to maintain, no applications to install (we install your applications/software on our servers), no computers to maintain, and no upgrades to perform. Users simply require Internet access and a standard web browser. Everything else is delivered by CTC.

Benefits of Remote Desktop Hosting

- The expense of server purchases are gone forever
- The expense of server management or network personnel are gone forever
- 99.9 % uptime for power - power outage problems are a thing of the past
